Guidance for using DOPS in dentistry
(Direct Observation of Procedural Skills)

Summary and overview

Direct Observation of Procedural Skills (DOPS) in dental specialty training is one of a number of assessments used in the clinical setting to help the teaching and assessment of a clinical skill in the workplace. In common with the other Workplace-Based Assessments (WBAs), its primary purpose is to provide structured teaching and feedback in a particular area of clinical practice. DOPS are applicable to short, diagnostic and interventional procedures, or part procedures, that comprise relatively few steps. They tend to be found most useful during the early years of specialty training.

The counterpart of DOPS for use with more substantial, operative procedures is the Procedure Based Assessment (PBA).

The DOPS assessment involves an assessor observing the trainee performing a practical procedure within the workplace. The assessor’s evaluation is recorded on a structured form which is used by the assessor to provide the trainee with structured feedback.

DOPS can be used routinely every time a trainee performs one of the procedures listed on the ISCP website, under supervision. The aim should be to make the exercise part of routine training practice.

Each DOPS assessment forms part of the trainee’s portfolio, which helps inform the report of the Assigned Educational Supervisor (AES) at the completion of each placement.

DOPS in the context of workplace-based assessment

A number of WBAs have been designed and made available for use during dental specialty training. Taken as a whole, there should be a WBA that will suit every training situation. For example: DOPS for short procedures or part procedures; CEX for directly observed clinical consultations; CBD for probing the clinical reasoning abilities of the trainee and so on. It is important that their purposes and modus operandi are understood. They should not be used in a mechanistic way. First and foremost, they should stimulate the assessor to observe all the aspects of the practice of the trainee and in so doing to gain adequate insights into the specific training needs of each trainee. Therefore, these WBAs are assessments for learning.

Towards the end of each placement or stage of training, the AES will use his/her knowledge of the trainee, the views of fellow consultant trainers and the training portfolio (of which the accumulated WBAs are a part) to form a judgement as to the overall progress achieved by the trainee. The annual review panel will use the evidence in the training portfolio, particularly the AES report to inform their decisions.

Who should assess DOPS?

Assessors should be known to, and approved by the trainee’s AES. Consultant clinical supervisors, more senior trainees and other healthcare professionals should also be encouraged to assess as this improves reliability. The AES should be one of the assessors during each placement.

Assessors should know how to use the DOPS and be expert in the clinical problem/task. Assessors need not have prior knowledge of the trainee and in some instances it may be important that they do not. In general, however, assessments of this kind will be carried out by the trainers since they provide useful insights on the training that is required.
When and how often should DOPS be carried out?

Each of the dental specialties has chosen to do different numbers of DOPS in the initial stages of their use and this may change as time progresses. Guidance will be given to trainers by the relevant SAC and Curriculum Implementation Group.

Given the great variation in the rate of progress between individuals, it is not possible to state absolute numbers. In clinical practice a number of observed performances, even if completed to a satisfactory level, are insufficient if not underpinned by adequate experience. It will be a matter of judgement for assigned educational supervisors and annual review panels to determine whether the experience element is sufficient when signing off their reports.

Ideally, trainees and assessors should use the assessment instruments at every possible opportunity. The great benefit of WBAs such as the DOPS is that by obliging the trainer to review the performance of the trainee across the full range of components involved in a procedure, a comprehensive picture of the trainee’s strengths and weaknesses can be obtained and kept under review during the whole placement.

Using the DOPS

The trainee’s learning agreement should indicate which DOPS are required. Patient safety and well-being remains paramount throughout. The assessor supervising the procedure should ensure that the patient is informed, has provided consent for the procedure and suffers no increased risk or discomfort. The supervisor retains responsibility for patient care throughout and will intervene if the situation requires.

The assessment may be initiated by the trainee or the assessor, but since there will usually be a number of trainers and assessors involved during each placement, it remains the responsibility of the trainee to take a proactive approach and to ensure that sufficient exercises are completed. The encounter should be representative of the trainee’s workload.

Trainees and assessors may find it most convenient to use a printed version of the assessment form. The assessor should observe the trainee undertaking the procedure and doing what they would normally do in that situation. Most procedures should take no longer than 15-20 minutes and should be concluded with 5-10 minutes of feedback. Assessors should record a rating for each competency on the assessment form.

After each assessment the trainee must transfer the assessment into his/her electronic learning portfolio at the earliest possible opportunity. Each of the original forms should be retained by the assessor in order to validate the electronic record of the assessment and then forwarded to the trainee’s AES as a means of validating the portfolio.

Completing the DOPS form

These notes may be helpful when using the DOPS form:

- **Trainee details**
  The trainee or assessor can complete the trainee’s details

- **Name of the procedure**
  The assessor should complete the name of the procedure

- **Number of times procedure performed by trainee**
  The assessor should ask the trainee for his/her estimation/logbook.

- **Difficulty of procedure**
  The assessor should score the difficulty of the procedure according to the stage of the trainee.

  Definition of *Easier than usual*: uneventful procedure without any of the commonly encountered problems or variations.

  Definition of *More difficult than usual*: unexpected problems, unrelated to the expertise of the trainee
• **Using the scale**
  Each item should be scored, N (*not observed or not appropriate*), D (*development required or needs improvement or satisfactory only after help or advice*), or S (*satisfactory standard for completion of early years / core surgical training (initial stage), with no prompts required*).

• **Item 6 (performs the technical aspects in line with the guidance notes)**
  One overall score is given for the technical aspects of the procedure (not for each of the technical steps). The Trainee/Trainer Guidance Points should be used to inform the rating given for item 6.

• **Global summary**
  If the trainee was observed by the assessor to have completed the entire procedure, a global statement should be chosen from the four levels shown.

  The four statements relate to the extent of supervision the trainee was seen to require in that procedure on that occasion. In order to achieve a global level 4 for an entire procedure, most (but not necessarily all) competencies should have been rated as satisfactory. Achieving a level 4 on one occasion does not confirm that the trainee is competent to perform that procedure unsupervised. This judgement will require repeated assessments by more than one assessor.

  Each assessment is not a pass or fail event, nor does it award a ‘licence’ to practise without assistance or direct supervision: that remains the prerogative of the supervisor, who has responsibility for patient care. The decision to permit a trainee to perform a procedure without supervision will depend on evidence from a number of DOPS of a sufficient standard (level 4). The number required to inform that decision will depend upon many factors, including the complexity of the procedure and the experience of the trainee. The evidence provided by the trainee’s logbook complements the process.

• **Assessor Training**
  Assessors must read the entire assessment form and guidance notes. The training methods undertaken should be indicated on the form and the assessor should be known to and approved by the AES if the assessment is to be filed in the portfolio.

• **Assessor details**
  The assessor should complete all his/her details indicated which may be used as a means of validation.

**The standards to be applied to DOPS assessments**

Trainees should record all assessments in the electronic portfolio including those they regard as unsatisfactory. At the start of a stage it would be normal for trainees to have some assessments which are less than satisfactory because their performance is not yet at the standard for the completion of that stage. In cases when assessments are less than satisfactory, trainees should repeat assessments as often as required to show progress.

One of the purposes of the assessment is to demonstrate to trainees and their AES that they are maintaining progress during the placement and that they are on course to reach the standard required by the syllabus and their learning agreements for successful completion of the stage.

The completion standards are as follows (NB: Not all have to be completed for each DOPS):

1. **Describes indications, anatomy, procedure and complications to assessor:**
   Clearly explains to the assessor the indication for the procedure, any relevant anatomy and essential steps of the procedure.

2. **Obtains consent, after explaining procedure & possible complications to the patient:**
   Conveys information that is complete, relevant, clear and jargon-free; is sensitive to patient’s concerns, respects confidentiality, actively listens, answers questions correctly and checks the patient’s understanding before obtaining consent; establishes trust.
3. **Prepares for procedure according to an agreed protocol:**
   Demonstrates clear pre-operative plan, identifies any special equipment required, makes all relevant safety checks, briefs other staff appropriately.

4. **Administers effective analgesia or safe sedation (if no anaesthetist):**
   Selects appropriate local anaesthetic agent (or sedative) and checks with nursing staff; injects appropriate volume using the correct needle and technique.

5. **Demonstrates good asepsis and safe use of instruments/sharps:**
   Supervises and follows high standards of aseptic operative technique; handles instruments and sharps safely.

6. **Performs the technical aspects in line with the guidance notes:**
   Follows the protocol for the procedure, demonstrates good technique; uses instruments appropriately, handles tissue gently, controls bleeding appropriately, sutures neatly and atraumatically. See Trainee/Trainer Guidance Points for the procedure.

7. **Deals with any unexpected event or seeks help when appropriate:**
   Anticipates and responds calmly and appropriately, communicates clearly and consistently with patients and staff, uses assistants to best advantage, has awareness of own limitations.

8. **Completes required documentation (written or dictated):**
   Makes clear and legible notes which enables effective care by other practitioners.

9. **Issues clear post-procedure instructions to patient and staff:**
   Makes a post-operative assessment; conveys relevant information orally and in writing; retains responsibility for the patient’s ongoing care.

10. **Communicates with patient & staff in a professional manner:**
    Demonstrates respect, and understanding of the patient’s needs for comfort, respect, and confidentiality; demonstrates an ethical approach, and awareness of any relevant legal frameworks.

**Feedback**

It must be emphasised that the most important purpose of the assessment exercise is to provide the trainee with formative feedback (i.e. information that forms and develops the trainee’s practice), offering a significant impact on learning. Scores are used only for the purpose of identifying strengths and weaknesses and providing accurate feedback on that performance.

Feedback should take about 5-10 minutes. It should be conducted in a suitable, quiet environment immediately after the assessment and should be constructive. Assessors should expand on the reasons for any ratings of Development required and make practical suggestions for any remedial steps if it is felt that the rate of progress is insufficient.

In this connection, it should be borne in mind that the AES has the facility to make substantial changes to the clinical timetable and sessional exposure that a trainee has during a placement, if it is deemed in the best interests of the trainee. It is expected that the trainers in any one placement work as a team and if an assessor, trainer or trainee feels that any such change might be indicated, then this should be brought to the notice of the AES at the earliest opportunity.

It is essential that trainees reflect on feedback and take a proactive approach to improving their practice.

**KEY POINTS**

**Summary of the method**
- Formative method designed to provide adequate insights into the specific training needs of the trainee
- Observed short, diagnostic and interventional procedures during routine dental specialty practice
- Covers patient safety, preparation, operative technique, communication and documentation
- Available for a comprehensive range of index procedures relevant to each specialty
- As training progresses and operative procedures become more relevant, DOPS are likely to be superseded by Procedure-based Assessment (PBA) for the index procedures for each specialty
Minimum number of assessments per year
- The number of DOPS in specialty training will depend on the specialty and the stage of training - the SAC or Curriculum Implementation Group for each specialty will give guidance regarding this.

Who should assess DOPS?
- The current Assigned Educational Supervisor must be one of the assessors
- Consultant clinical supervisors, senior specialty registrars, staff grades and other health care professionals who are expert in the clinical problem/task and who have been trained in objective assessment and giving feedback.
- Assessors do not need to have prior knowledge of the trainee.

Time needed
- Observation will be as long as the procedure itself plus about 15-20 minutes to complete the form
- 5-10 minutes for debriefing and feedback

Appropriate assessment settings
- Out-patients
- Theatre
- A & E
- Ward
